

Attaching the outer sheath of the optical cable

Overview

Ring the outer sheath, with the sheath knife, four (4) to six (6) inches from the cable end. Gently flex the cable at the ring cut to separate the sheath. Where reels are supplied with protective material fitted over the cable, the protection should remain in place until the cable will be installed. The cable should be bent as little as possible. Turn-backs and all sharp changes of direction. This best practices document is a step-by-step guide for end and midspan access of loose tube optical cable, including sheath removal, core preparation, and fiber preparation. Local company practices and/or vendor specifications may be in place concerning cable access and how it relates to a. Lead dust may be released into the manhole atmosphere any time the sheath of older lead sheath cable is disturbed. Please see below for further information.
