

Configuration parameters for circuit breakers in home electrical distribution boxes

AI Overview

Home electrical distribution boxes should be configured with properly sized 1P, 2P, and RCD breakers, organized by load type and area, to ensure safety, efficiency, and compliance with electrical codes.

Key Components and Layout

Main Breaker (Isolator): The main switch controls the entire electrical supply to the home. It allows you to safely turn off all power during maintenance or emergencies.

Busbars: Copper busbars distribute electricity from the main breaker to all branch breakers. Using a comb busbar is safer and more efficient than multiple jumper wires.

Residual Current Devices (RCDs): RCDs detect leakage currents and cut power instantly to prevent electric shocks. They can be separate from the main switch for easier fault detection.

Branch Circuit Breakers: These protect individual circuits, such as lighting, sockets, and appliances. They are selected based on the load and type of device.

Wiring Connections

Live (L) Wire: Connects to the line terminal of each breaker, supplying power from the mains.

Neutral (N) Wire: For 1P breakers, the neutral bypasses the breaker and connects directly to the neutral busbar. For 2P breakers, both live and neutral are switched simultaneously.

Protective Earth (PE) Wire: Connects to the ground busbar, especially for breakers with RCD protection, ensuring safety against earth faults.

Types of Breakers

1P (Single-Pole): Controls one phase line, typically used for lighting or small appliances.

2P (Double-Pole): Controls both live and neutral, used for higher-power appliances or circuits requiring full disconnection.

RCD or 1P+N: Provides additional protection against leakage currents.
