

Does hyperconverged infrastructure not require fiber optic switches

Overview

Unlike traditional storage, HCI does not require high upfront costs, costly fiber channel networking, or specialized teams for manual operations, driving down CapEx and OpEx. Cisco HyperFlex™ systems have established themselves as a premier hyperconverged hardware platform for computing virtualization in companies of all sizes. Cisco HyperFlex systems are based on Cisco Unified Computing System™ (Cisco UCS®) hardware, combining Cisco HyperFlex HX-Series x86 rack-mount. Four weeks of testing, a huge cable bill, and one extremely hot office later, here's what actually worked—and what didn't. With two DGX nodes, it's trivial. One QSFP56 DAC cable, a /31 subnet, done. I got near-linear scaling on tensor-parallel workloads because the latency was basically zero—just a. Hyper-converged infrastructure (HCI) is a software-defined IT infrastructure that virtualizes all elements of the conventional "hardware-defined" systems. Multiple sets of unit devices can be aggregated through the network to achieve modular seamless scale-out.

Hyper-converged infrastructure

Hyper-converged infrastructure (HCI) is a software-defined IT infrastructure that virtualizes all elements of the conventional "hardware-defined" systems. HCI includes, at a minimum, virtualized computing (a hypervisor), software-defined storage, and virtualized networking (software-defined networking). HCI typically runs on commercial off-the-shelf (COTS) servers.
