

Equipotential grounding of the distribution box enclosure

Overview

In the distribution box, the **equipotential phenomenon** refers to connecting all the metal components inside the distribution box (such as the enclosure, PE wire, grounding busbar, metal brackets, etc.) into a **whole with equal potential** through conductors, so as. In industrial and civil circuit wiring, the stainless steel monitor enclosure device serves as the physical casing for various switches and control components. Ofenders will be held liable for the payment of damages. All rights reserved in the event of the grant of a patent, utility model or. The drive system in this manual consists of the supply transformer, input power cable of the drive, the variable speed drive (frequency converter), motor cable and motor. The purpose of. The general difference between equipotential bonding and equipotential grounding is the event of an electrical fault or surge, lighting strikes or accidental contacts, electricity will flow through the bonded components.
