

Galvanized cable trays for computer room

AI Overview

Pre-galvanized (PG) and perforated galvanized cable trays are the most common choices for computer rooms due to their corrosion resistance, load support, and ventilation capabilities. Types of Galvanized Cable Trays

- 1. Pre-Galvanized (PG) Steel Trays** Pre-galvanized trays are made from steel sheets coated with zinc before fabrication. They are ideal for dry indoor environments like computer rooms because they provide sufficient corrosion resistance for controlled conditions, are cost-effective, and have a smooth finish that supports neat cable routing. The zinc coating typically ranges from 12 to 20 microns, which is adequate for office or data center settings.
- 2. Hot-Dip Galvanized (HDG) Steel Trays** HDG trays are dipped in molten zinc, creating a thicker, more durable coating (65–85 microns) that protects against moisture and outdoor exposure. While overkill for most computer rooms, HDG trays are suitable if the room has higher humidity or occasional water exposure.
- 3. Perforated Cable Trays** Perforated trays feature holes along the base and sides, allowing airflow and heat dissipation, which is critical in computer rooms to prevent overheating of network and power cables. They also facilitate cable tie installation and easy modifications.
- 4. Basket or Wire Mesh Trays** Wire basket trays are lightweight, flexible, and provide excellent ventilation. They are particularly useful for dynamic IT setups where frequent cable additions or changes occur. Their open design allows easy access for maintenance and reconfiguration.

Key Considerations for Computer Rooms

- Load Capacity:** Ensure the tray can support the weight of all network, power, and fiber optic cables without sagging. Compliance with standards like IEC 61537 or NEMA VE 1 ensures structural reliability.
- Ventilation:** Perforated or mesh trays help prevent heat buildup, which is essential for sensitive IT equipment.
- Corrosion Resistance:** Pre-galvanized trays are sufficient for indoor computer rooms, while HDG trays are recommended for areas with higher humidity or potential water exposure.
