

# How to cover electrical wires in street-side electrical distribution boxes

## Overview

In many cases, the easiest solution is sheathing the wires. The National Electrical Code requires support within a specific distance of all boxes and fittings, and then at 3 to 5-foot intervals along the run to prevent sagging and stress on joints. When running the wire into a building, use a weatherhead or an LB conduit body fitting to create a watertight. This article aims to provide a comprehensive guide on how to effectively cover an outdoor electrical box. Exposed wires present trip hazards, are susceptible to weather damage, and can become a target for pests or accidental severing. For example, if nothing is covering the power cord to your outdoor patio lights, attach a bungee cord around the cable and run it. When deciding how to hide outdoor cables on the side of a house you can choose from hiding them behind features or plants, inside the walls, with cable covers, underneath siding panels or roof eaves, or with paint. Sometimes, hiding cables is as simple as finding a structure they can hide behind. The most effective strategies involve constructing a removable decorative screen or using strategic landscaping to integrate the panel into the surrounding environment.
