

Increase light intensity via optical module

Overview

Electro-optic modulators, based on Pockels cells, modulate light intensity by varying the applied voltage. For purchasing, use the RP Photonics Buyer's Guide for intensity modulators. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions. What is an Intensity Modulator?

There. Modulating the output power of a laser diode can happen in two ways: by changing the signal input/driving current ^{1,2} or by alternating the continuous wave output after the light is generated. ² In laser modulation, the current or voltage varies with time to modulate the output signal from the. An acousto-optic modulator (AOM) is a device which can be used for controlling the transmitted power of a laser beam with an electrical drive signal.
