

The core switch is a Layer 2 switch

Overview

A core switch operates mainly at Layer 2 of the OSI model. Its primary purpose is to provide ultra-fast and efficient packet forwarding within the network. Core switches do not concern themselves with Layer 3 routing functions, which are typically handled by core routers in larger. A core switch in networking serves as the high-capacity backbone, centralizing data flow and ensuring efficient communication between different network segments. What Is a Core Switch? Network Backbone Architecture Guide

To achieve backbone speeds, a core switch must operate at Layer 3 of the OSI model, bridging the gap between traditional MAC-based switching and IP-based routing.

Differences Between the Core Switch and Normal

A core switch is not a type of switch, but a switch placed at the core layer (the backbone of the network). Generally, large-scale enterprise networks
