

What is the optical splitter inside a ring main unit

Overview

A fiber-optic splitter, also known as a beam splitter, is based on a quartz substrate of an integrated waveguide optical power distribution device, similar to a coaxial cable transmission system. The optical network system uses an optical signal coupled to the. All ring main units are made up of one or more of the following: MV metering tank. The ring main switch enables the underground cable system to be isolated in sections, and the interconnection of adjacent feeders. It normally includes two ring feeder switching units and one transformer feeder protected by a fuse-switch or circuit breaker. The RMU allows operators to. A Ring Main Unit (RMU) is a totally sealed, gas-insulated compact switchgear unit. Different combinations of these primary switching devices within the unit are commonly used.
