

Where are optical modules installed on communication towers

Overview

The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into light signals. Telecommunication towers are the unsung heroes in a world powered by instant communication and data exchange. These towering structures form the backbone of mobile networks, enabling everything from voice calls to high-speed internet access, making digital connectivity possible. These modules typically consist of a transmitter, which converts electrical signals into a light signal, and a receiver, which converts the received signal back. The Nokia industry-leading optical network portfolio leverages highly vertically integrated coherent optical engines and includes the latest generation of open and flexible optical line systems, intelligent coherent pluggables, ultra power-efficient intra-data center optics, AI-powered network.
